# The Mycielskian of a Graph ${ }^{1}$ 

Piotr Rudnicki<br>University of Alberta<br>Edmonton, Canada

Lorna Stewart<br>University of Alberta<br>Edmonton, Canada

Summary. Let $\omega(G)$ and $\chi(G)$ be the clique number and the chromatic number of a graph $G$. Mycielski [11] presented a construction that for any $n$ creates a graph $M_{n}$ which is triangle-free $(\omega(G)=2)$ with $\chi(G)>n$. The starting point is the complete graph of two vertices $\left(K_{2}\right) . M_{(n+1)}$ is obtained from $M_{n}$ through the operation $\mu(G)$ called the Mycielskian of a graph $G$.

We first define the operation $\mu(G)$ and then show that $\omega(\mu(G))=\omega(G)$ and $\chi(\mu(G))=\chi(G)+1$. This is done for arbitrary graph $G$, see also [10]. Then we define the sequence of graphs $M_{n}$ each of exponential size in $n$ and give their clique and chromatic numbers.

MML identifier: MYCIELSK, version: $\underline{7.11 .074 .156 .1112}$

The notation and terminology used here have been introduced in the following papers: [1], [15], [13], [8], [5], [2], [14], [9], [16], [3], [6], [18], [19], [12], [17], [4], and $[7]$.

## 1. Preliminaries

One can prove the following propositions:
(1) For all real numbers $x, y, z$ such that $0 \leq x$ holds $x \cdot\left(y-^{\prime} z\right)=x \cdot y-^{\prime} x \cdot z$.
(2) For all natural numbers $x, y, z$ holds $x \in y \backslash z$ iff $z \leq x<y$.
(3) For all sets $A, B, C, D, E, X$ such that $X \subseteq A$ or $X \subseteq B$ or $X \subseteq C$ or $X \subseteq D$ or $X \subseteq E$ holds $X \subseteq A \cup B \cup C \cup D \cup E$.
(4) For all sets $A, B, C, D, E, x$ holds $x \in A \cup B \cup C \cup D \cup E$ iff $x \in A$ or $x \in B$ or $x \in C$ or $x \in D$ or $x \in E$.

[^0](5) Let $R$ be a symmetric relational structure and $x, y$ be sets. Suppose $x \in$ the carrier of $R$ and $y \in$ the carrier of $R$ and $\langle x, y\rangle \in$ the internal relation of $R$. Then $\langle y, x\rangle \in$ the internal relation of $R$.
(6) For every symmetric relational structure $R$ and for all elements $x, y$ of $R$ such that $x \leq y$ holds $y \leq x$.

## 2. Partitions

One can prove the following proposition
(7) For every set $X$ and for every partition $P$ of $X$ holds $\overline{\bar{P}} \subseteq \overline{\bar{X}}$.

Let $X$ be a set, let $P$ be a partition of $X$, and let $S$ be a subset of $X$. The functor $P \upharpoonright S$ yields a partition of $S$ and is defined by:
(Def. 1) $\quad P \upharpoonright S=\{x \cap S ; x$ ranges over elements of $P: x$ meets $S\}$.
Let $X$ be a set. Observe that there exists a partition of $X$ which is finite.
Let $X$ be a set, let $P$ be a finite partition of $X$, and let $S$ be a subset of $X$. Observe that $P \upharpoonright S$ is finite.

One can prove the following propositions:
(8) For every set $X$ and for every finite partition $P$ of $X$ and for every subset $S$ of $X$ holds $\overline{\overline{P\lceil S}} \leq \overline{\bar{P}}$.
(9) Let $X$ be a set, $P$ be a finite partition of $X$, and $S$ be a subset of $X$. Then for every set $p$ such that $p \in P$ holds $p$ meets $S$ if and only if $\overline{\overline{P \upharpoonright S}}=\overline{\bar{P}}$.
(10) Let $R$ be a relational structure, $C$ be a coloring of $R$, and $S$ be a subset of $R$. Then $C \upharpoonright S$ is a coloring of $\operatorname{sub}(S)$.

## 3. Chromatic Number and Clique Cover Number

Let $R$ be a relational structure. We say that $R$ is finitely colorable if and only if:
(Def. 2) There exists a coloring of $R$ which is finite.
One can check that there exists a relational structure which is finitely colorable.

Let us observe that every relational structure which is finite is also finitely colorable.

Let $R$ be a finitely colorable relational structure. Observe that there exists a coloring of $R$ which is finite.

Let $R$ be a finitely colorable relational structure and let $S$ be a subset of $R$. One can verify that $\operatorname{sub}(S)$ is finitely colorable.

Let $R$ be a finitely colorable relational structure. The functor $\chi(R)$ yielding a natural number is defined by:
(Def. 3) There exists a finite coloring $C$ of $R$ such that $\overline{\bar{C}}=\chi(R)$ and for every finite coloring $C$ of $R$ holds $\chi(R) \leq \overline{\bar{C}}$.
Let $R$ be an empty relational structure. Observe that $\chi(R)$ is empty.
Let $R$ be a non empty finitely colorable relational structure. Observe that $\chi(R)$ is positive.

Let $R$ be a relational structure. We say that $R$ has finite clique cover if and only if:
(Def. 4) There exists a clique-partition of $R$ which is finite.
One can verify that there exists a relational structure which has finite clique cover.

One can verify that every relational structure which is finite has also finite clique cover.

Let $R$ be a relational structure with finite clique cover. Observe that there exists a clique-partition of $R$ which is finite.

Let $R$ be a relational structure with finite clique cover and let $S$ be a subset of $R$. Observe that $\operatorname{sub}(S)$ has finite clique cover.

Let $R$ be a relational structure with finite clique cover. The functor $\kappa(R)$ yielding a natural number is defined by:
(Def. 5) There exists a finite clique-partition $C$ of $R$ such that $\overline{\bar{C}}=\kappa(R)$ and for every finite clique-partition $C$ of $R$ holds $\kappa(R) \leq \overline{\bar{C}}$.
Let $R$ be an empty relational structure. One can check that $\kappa(R)$ is empty.
Let $R$ be a non empty relational structure with finite clique cover. One can verify that $\kappa(R)$ is positive.

We now state several propositions:
(11) For every finite relational structure $R$ holds $\omega(R) \leq \overline{\overline{\text { the carrier of } R}}$.
(12) For every finite relational structure $R$ holds $\alpha(R) \leq \overline{\overline{\text { the carrier of } R}}$.

(14) For every finite relational structure $R$ holds $\kappa(R) \leq \overline{\overline{\text { the carrier of } R}}$.
(15) For every finitely colorable relational structure $R$ with finite clique number holds $\omega(R) \leq \chi(R)$.
(16) For every relational structure $R$ with finite stability number and finite clique cover holds $\alpha(R) \leq \kappa(R)$.

## 4. Complement

The following two propositions are true:
(17) Let $R$ be a relational structure, $x, y$ be elements of $R$, and $a, b$ be elements of ComplRelStr $R$. If $x=a$ and $y=b$ and $x \leq y$, then $a \not \leq b$.
(18) Let $R$ be a relational structure, $x, y$ be elements of $R$, and $a, b$ be elements of ComplRelStr $R$. If $x=a$ and $y=b$ and $x \neq y$ and $x \in$ the carrier of $R$ and $a \not \leq b$, then $x \leq y$.
Let $R$ be a finite relational structure. Note that ComplRelStr $R$ is finite.
Next we state four propositions:
(19) For every symmetric relational structure $R$ holds every clique of $R$ is a stable set of ComplRelStr $R$.
(20) For every symmetric relational structure $R$ holds every clique of ComplRelStr $R$ is a stable set of $R$.
(21) For every relational structure $R$ holds every stable set of $R$ is a clique of ComplRelStr $R$.
(22) For every relational structure $R$ holds every stable set of ComplRelStr $R$ is a clique of $R$.
Let $R$ be a relational structure with finite clique number.
One can verify that ComplRelStr $R$ has finite stability number.
Let $R$ be a symmetric relational structure with finite stability number. Observe that ComplRelStr $R$ has finite clique number.

The following propositions are true:
(23) For every symmetric relational structure $R$ with finite clique number holds $\omega(R)=\alpha(\operatorname{ComplRelStr} R)$.
(24) For every symmetric relational structure $R$ with finite stability number holds $\alpha(R)=\omega($ ComplRelStr $R)$.
(25) For every relational structure $R$ holds every coloring of $R$ is a cliquepartition of ComplRelStr $R$.
(26) For every symmetric relational structure $R$ holds every clique-partition of ComplRelStr $R$ is a coloring of $R$.
(27) For every symmetric relational structure $R$ holds every clique-partition of $R$ is a coloring of ComplRelStr $R$.
(28) For every relational structure $R$ holds every coloring of ComplRelStr $R$ is a clique-partition of $R$.
Let $R$ be a finitely colorable relational structure.
Observe that ComplRelStr $R$ has finite clique cover.
Let $R$ be a symmetric relational structure with finite clique cover. One can check that ComplRelStr $R$ is finitely colorable.

The following propositions are true:
(29) For every finitely colorable symmetric relational structure $R$ holds $\chi(R)=\kappa($ ComplRelStr $R)$.
(30) For every symmetric relational structure $R$ with finite clique cover holds $\kappa(R)=\chi($ ComplRelStr $R)$.

## 5. Adjacent Set

Let $R$ be a relational structure and let $v$ be an element of $R$. The functor Adjacent $(v)$ yields a subset of $R$ and is defined as follows:
(Def. 6) For every element $x$ of $R$ holds $x \in \operatorname{Adjacent}(v)$ iff $x<v$ or $v<x$.
The following proposition is true
(31) Let $R$ be a finitely colorable relational structure, $C$ be a finite coloring of $R$, and $c$ be a set. Suppose $c \in C$ and $\overline{\bar{C}}=\chi(R)$. Then there exists an element $v$ of $R$ such that $v \in c$ and for every element $d$ of $C$ such that $d \neq c$ there exists an element $w$ of $R$ such that $w \in \operatorname{Adjacent}(v)$ and $w \in d$.

## 6. Natural Numbers as Vertices

Let $n$ be a natural number. A strict relational structure is said to be a relational structure of $n$ if:
(Def. 7) The carrier of it $=n$.
Let us observe that every relational structure of 0 is empty.
Let $n$ be a non empty natural number. Note that every relational structure of $n$ is non empty.

Let $n$ be a natural number. Note that every relational structure of $n$ is finite and there exists a relational structure of $n$ which is irreflexive.

Let $n$ be a natural number. The functor $K(n)$ yields a relational structure of $n$ and is defined as follows:
(Def. 8) The internal relation of $K(n)=n \times n \backslash \mathrm{id}_{n}$.
The following proposition is true
(32) Let $n$ be a natural number and $x, y$ be sets. Suppose $x, y \in n$. Then $\langle x$, $y\rangle \in$ the internal relation of $K(n)$ if and only if $x \neq y$.
Let $n$ be a natural number. Note that $K(n)$ is irreflexive and symmetric.
Let $n$ be a natural number. Observe that $\Omega_{K(n)}$ is a clique.
The following propositions are true:
(33) For every natural number $n$ holds $\omega(K(n))=n$.
(34) For every non empty natural number $n$ holds $\alpha(K(n))=1$.
(35) For every natural number $n$ holds $\chi(K(n))=n$.
(36) For every non empty natural number $n$ holds $\kappa(K(n))=1$.

## 7. Mycielskian of a Graph

Let $n$ be a natural number and let $R$ be a relational structure of $n$. The functor Mycielskian $R$ yields a relational structure of $2 \cdot n+1$ and is defined by the condition (Def. 9).
(Def. 9) The internal relation of Mycielskian $R=($ the internal relation of $R) \cup$ $\{\langle x, y+n\rangle ; x$ ranges over elements of $\mathbb{N}, y$ ranges over elements of $\mathbb{N}:\langle x$, $y\rangle \in$ the internal relation of $R\} \cup\{\langle x+n, y\rangle ; x$ ranges over elements of $\mathbb{N}$, $y$ ranges over elements of $\mathbb{N}:\langle x, y\rangle \in$ the internal relation of $R\} \cup\{2 \cdot n\} \times$ $(2 \cdot n \backslash n) \cup(2 \cdot n \backslash n) \times\{2 \cdot n\}$.
One can prove the following propositions:
(37) Let $n$ be a natural number and $R$ be a relational structure of $n$. Then the carrier of $R \subseteq$ the carrier of Mycielskian $R$.
(38) Let $n$ be a natural number, $R$ be a relational structure of $n$, and $x, y$ be natural numbers. Suppose $\langle x, y\rangle \in$ the internal relation of Mycielskian $R$. Then
(i) $x<n$ and $y<n$, or
(ii) $x<n \leq y<2 \cdot n$, or
(iii) $n \leq x<2 \cdot n$ and $y<n$, or
(iv) $x=2 \cdot n$ and $n \leq y<2 \cdot n$, or
(v) $n \leq x<2 \cdot n$ and $y=2 \cdot n$.
(39) Let $n$ be a natural number and $R$ be a relational structure of $n$. Then the internal relation of $R \subseteq$ the internal relation of Mycielskian $R$.
(40) Let $n$ be a natural number, $R$ be a relational structure of $n$, and $x, y$ be sets. Suppose $x, y \in n$ and $\langle x, y\rangle \in$ the internal relation of Mycielskian $R$. Then $\langle x, y\rangle \in$ the internal relation of $R$.
(41) Let $n$ be a natural number, $R$ be a relational structure of $n$, and $x, y$ be natural numbers. Suppose $\langle x, y\rangle \in$ the internal relation of $R$. Then $\langle x, y+n\rangle \in$ the internal relation of Mycielskian $R$ and $\langle x+n, y\rangle \in$ the internal relation of Mycielskian $R$.
(42) Let $n$ be a natural number, $R$ be a relational structure of $n$, and $x, y$ be natural numbers. Suppose $x \in n$ and $\langle x, y+n\rangle \in$ the internal relation of Mycielskian $R$. Then $\langle x, y\rangle \in$ the internal relation of $R$.
(43) Let $n$ be a natural number, $R$ be a relational structure of $n$, and $x, y$ be natural numbers. Suppose $y \in n$ and $\langle x+n, y\rangle \in$ the internal relation of Mycielskian $R$. Then $\langle x, y\rangle \in$ the internal relation of $R$.
(44) Let $n$ be a natural number, $R$ be a relational structure of $n$, and $m$ be a natural number. Suppose $n \leq m<2 \cdot n$. Then $\langle m, 2 \cdot n\rangle \in$ the internal relation of Mycielskian $R$ and $\langle 2 \cdot n, m\rangle \in$ the internal relation of Mycielskian $R$.
(45) Let $n$ be a natural number, $R$ be a relational structure of $n$, and $S$ be a subset of Mycielskian $R$. If $S=n$, then $R=\operatorname{sub}(S)$.
(46) For every natural number $n$ and for every irreflexive relational structure $R$ of $n$ such that $2 \leq \omega(R)$ holds $\omega(R)=\omega($ Mycielskian $R)$.
(47) For every finitely colorable relational structure $R$ and for every subset $S$ of $R$ holds $\chi(R) \geq \chi(\operatorname{sub}(S))$.
(48) For every natural number $n$ and for every irreflexive relational structure $R$ of $n$ holds $\chi($ Mycielskian $R)=1+\chi(R)$.
Let $n$ be a natural number. The functor Mycielskian $n$ yielding a relational structure of $3 \cdot 2^{n}-^{\prime} 1$ is defined by the condition (Def. 10).
(Def. 10) There exists a function $m_{1}$ such that
(i) Mycielskian $n=m_{1}(n)$,
(ii) $\operatorname{dom} m_{1}=\mathbb{N}$,
(iii) $\quad m_{1}(0)=K(2)$, and
(iv) for every natural number $k$ and for every relational structure $R$ of $3 \cdot 2^{k}-^{\prime} 1$ such that $R=m_{1}(k)$ holds $m_{1}(k+1)=$ Mycielskian $R$.
The following proposition is true
(49) Mycielskian $0=K(2)$ and for every natural number $k$ holds $\operatorname{Mycielskian}(k+1)=$ Mycielskian Mycielskian $k$.
Let $n$ be a natural number. One can verify that Mycielskian $n$ is irreflexive.
Let $n$ be a natural number. Observe that Mycielskian $n$ is symmetric.
We now state three propositions:
(50) For every natural number $n$ holds $\omega(\operatorname{Mycielskian} n)=2$ and $\chi($ Mycielskian $n)=n+2$.
(51) For every natural number $n$ there exists a finite relational structure $R$ such that $\omega(R)=2$ and $\chi(R)>n$.
(52) For every natural number $n$ there exists a finite relational structure $R$ such that $\alpha(R)=2$ and $\kappa(R)>n$.
