

# Gauge Integral

Roland Coghetto Rue de la Brasserie 5 7100 La Louvière, Belgium

**Summary.** Some authors have formalized the integral in the Mizar Mathematical Library (MML). The first article in a series on the Darboux/Riemann integral was written by Noboru Endou and Artur Korniłowicz: [6]. The Lebesgue integral was formalized a little later [13] and recently the integral of Riemann-Stieltjes was introduced in the MML by Keiko Narita, Kazuhisa Nakasho and Yasunari Shidama [12].

A presentation of definitions of integrals in other proof assistants or proof checkers (ACL2, COQ, Isabelle/HOL, HOL4, HOL Light, PVS, ProofPower) may be found in [10] and [4].

Using the Mizar system [1], we define the Gauge integral (Henstock-Kurzweil) of a real-valued function on a real interval [a, b] (see [2], [3], [15], [14], [11]). In the next section we formalize that the Henstock-Kurzweil integral is linear.

In the last section, we verified that a real-valued bounded integrable (in sense Darboux/Riemann [6, 7, 8]) function over a interval a, b is Gauge integrable.

Note that, in accordance with the possibilities of the MML [9], we reuse a large part of demonstrations already present in another article. Instead of rewriting the proof already contained in [7] (MML Version: 5.42.1290), we slightly modified this article in order to use directly the expected results.

#### 1. Preliminaries

From now on a, b, c, d, e denote real numbers. Now we state the propositions:

© 2017 University of Białystok CC-BY-SA License ver. 3.0 or later ISSN 1426-2630(Print), 1898-9934(Online)

- (1) If  $a b \le c$  and  $b \le a$ , then  $|b a| \le c$ .
- (2) If  $b a \le c$  and  $a \le b$ , then  $|b a| \le c$ .
- (3) If  $a \le b \le c$  and  $|a-d| \le e$  and  $|c-d| \le e$ , then  $|b-d| \le e$ .
- (4) If for every c such that 0 < c holds  $|a b| \le c$ , then a = b.
- (5) Let us consider non negative real numbers b, c, d. Suppose  $d < \frac{e}{2 \cdot b \cdot |c|}$ . Then
  - (i) b is positive, and
  - (ii) c is positive.
- (6) If  $a \neq 0$ , then  $a \cdot \frac{b}{2 \cdot a} = \frac{b}{2}$ .
- (7) Let us consider non negative real numbers b, c, d. Suppose  $a \leq b \cdot c \cdot d$  and  $d < \frac{e}{2 \cdot b \cdot |c|}$ . Then  $a \leq \frac{e}{2}$ . The theorem is a consequence of (5) and (6).

## 2. Vector Lattice / Riesz Space

Let X be a non empty set and f, g be functions from X into  $\mathbb{R}$ . The functor  $\min(f, g)$  yielding a function from X into  $\mathbb{R}$  is defined by

(Def. 1) for every element x of X,  $it(x) = \min(f(x), g(x))$ .

One can verify that the functor is commutative. The functor  $\max(f,g)$  yielding a function from X into  $\mathbb{R}$  is defined by

(Def. 2) for every element x of X,  $it(x) = \max(f(x), g(x))$ .

Note that the functor is commutative.

Let f, g be positive yielding functions from X into  $\mathbb{R}$ . One can check that  $\min(f, g)$  is positive yielding and  $\max(f, g)$  is positive yielding.

Let f, g be functions from X into  $\mathbb{R}$ . We say that  $f \leq g$  if and only if

(Def. 3) for every element x of X,  $f(x) \leq g(x)$ .

Now we state the proposition:

(8) Let us consider a non empty set X, and functions f, g from X into  $\mathbb{R}$ . Then  $\min(f,g) \leq f$ .

Let us consider a non empty, real-membered set X. Now we state the propositions:

- (9) If for every real number r such that  $r \in X$  holds  $\sup X = r$ , then there exists a real number r such that  $X = \{r\}$ .
- (10) If for every real number r such that  $r \in X$  holds inf X = r, then there exists a real number r such that  $X = \{r\}$ .
- (11) Let us consider a non empty, lower bounded, upper bounded, real-membered set X. Suppose  $\sup X = \inf X$ . Then there exists a real number r such that  $X = \{r\}$ . The theorem is a consequence of (9).

#### 3. Some Properties of the $\chi$ Function

In the sequel X, Y denote sets, Z denotes a non empty set, r denotes a real number, s denotes an extended real, A denotes a subset of  $\mathbb{R}$ , and f denotes a real-valued function.

Now we state the propositions:

- (12)  $\chi_{X,Y}$  is a function from Y into  $\mathbb{R}$ .
- (13) If  $A \subseteq [r, s[$ , then A is lower bounded.
- (14) If  $A \subseteq [s, r[$ , then A is upper bounded.
- (15) If rng  $f \subseteq [a, b]$ , then f is bounded.
- (16) If  $a \leq b$ , then  $\{a, b\} \subseteq [a, b]$ .
- (17)  $\chi_{X,Y}$  is bounded. The theorem is a consequence of (16) and (15).
- (18) If X misses Y, then for every element x of X,  $\chi_{Y,X}(x) = 0$ .
- (19) Let us consider a function f from Z into  $\mathbb{R}$ . Then f is constant if and only if there exists a real number r such that  $f = r \cdot \chi_{Z,Z}$ .
- (20)  $\chi_{X,X}$  is positive yielding.

#### 4. Refinement of Tagged Partition

In the sequel I denotes a non empty, closed interval subset of  $\mathbb{R}$ ,  $T_1$  denotes a tagged partition of I, D denotes a partition of I, T denotes an element of the set of tagged partitions of D, and f denotes a partial function from I to  $\mathbb{R}$ .

Now we state the propositions:

- (21) If f is lower integrable, then lower\_sum $(f, D) \leq \text{lower_integral } f$ .
- (22) If f is upper integrable, then upper\_integral  $f \leq \text{upper\_sum}(f, D)$ .

Let A be a non empty, closed interval subset of  $\mathbb{R}$ . The functor tagged-divs(A) yielding a set is defined by

(Def. 4) for every set  $x, x \in it$  iff x is a tagged partition of A.

One can check that tagged-divs(A) is non empty.

Let  $T_1$  be a tagged partition of A. The functor  $T_1$ -tags yielding a non empty, non-decreasing finite sequence of elements of  $\mathbb{R}$  is defined by

(Def. 5) there exists a partition D of A and there exists an element T of the set of tagged partitions of D such that it = T and  $T_1 = \langle D, T \rangle$ .

Now we state the propositions:

- (23) If  $T_1 = \langle D, T \rangle$ , then  $T = T_1$ -tags and  $D = T_1$ -partition.
- (24)  $len(T_1-tags) = len(T_1-partition)$ . The theorem is a consequence of (23).

Let A be a non empty, closed interval subset of  $\mathbb{R}$  and  $T_1$  be a tagged partition of A. The functor len  $T_1$  yielding an element of  $\mathbb{N}$  is defined by the term

(Def. 6)  $len(T_1-partition)$ .

The functor dom  $T_1$  yielding a set is defined by the term

(Def. 7)  $dom(T_1-partition)$ .

Now we state the propositions:

- (25) Let us consider a non empty, closed interval subset I of  $\mathbb{R}$ , a partition D of I, and an element T of the set of tagged partitions of D. Then rng  $T \subseteq I$ .
- (26) Let us consider a non empty, closed interval subset I of  $\mathbb{R}$ , positive yielding functions  $j_1$ ,  $j_2$  from I into  $\mathbb{R}$ , and a  $j_1$ -fine tagged partition  $T_1$  of I. If  $j_1 \leq j_2$ , then  $T_1$  is a  $j_2$ -fine tagged partition of I. The theorem is a consequence of (23), (24), and (25).

## 5. Definition of the Gauge Integral on a Real Bounded Interval

Let I be a non empty, closed interval subset of  $\mathbb{R}$ , f be a partial function from I to  $\mathbb{R}$ , and  $T_1$  be a tagged partition of I. The functor tagged-volume $(f, T_1)$  yielding a finite sequence of elements of  $\mathbb{R}$  is defined by

(Def. 8) len  $it = \text{len } T_1$  and for every natural number i such that  $i \in \text{dom } T_1$  holds  $it(i) = f((T_1\text{-tags})(i)) \cdot \text{vol}(\text{divset}(T_1\text{-partition}, i)).$ 

The functor tagged-sum $(f, T_1)$  yielding a real number is defined by the term (Def. 9)  $\sum$  (tagged-volume $(f, T_1)$ ).

Now we state the proposition:

(27) If  $Y \subseteq X$ , then  $\chi_{X,Y} = \chi_{Y,Y}$ .

From now on f denotes a function from I into  $\mathbb{R}$ .

Now we state the propositions:

- (28) If I is non empty and trivial, then vol(I) = 0.
- (29) Let us consider a real number r. If  $I = \{r\}$ , then for every partition D of I,  $D = \langle r \rangle$ .

Let I be a non empty, closed interval subset of  $\mathbb{R}$  and f be a function from I into  $\mathbb{R}$ . We say that f is HK-integrable if and only if

(Def. 10) there exists a real number J such that for every real number  $\varepsilon$  such that  $\varepsilon > 0$  there exists a positive yielding function j from I into  $\mathbb{R}$  such that for every tagged partition  $T_1$  of I such that  $T_1$  is j-fine holds  $|\operatorname{tagged-sum}(f, T_1) - J| \leq \varepsilon$ .

Assume f is HK-integrable. The functor HK-integral (f) yielding a real number is defined by

(Def. 11) for every real number  $\varepsilon$  such that  $\varepsilon > 0$  there exists a positive yielding function j from I into  $\mathbb{R}$  such that for every tagged partition  $T_1$  of I such that  $T_1$  is j-fine holds  $| \text{tagged-sum}(f, T_1) - it | \leq \varepsilon$ .

Now we state the propositions:

- (30) Let us consider a function f from I into  $\mathbb{R}$ . Suppose I is trivial. Then
  - (i) f is HK-integrable, and
  - (ii) HK-integral(f) = 0.

The theorem is a consequence of (20), (12), and (29).

- (31) If A misses I and  $f = \chi_{A,I}$ , then tagged-sum $(f, T_1) = 0$ . PROOF: For every natural number i such that  $i \in \text{dom } T_1$  holds  $(\text{tagged-volume}(f, T_1))(i) = 0$ .  $\square$
- (32) If A misses I and  $f = \chi_{A,I}$ , then f is HK-integrable and HK-integral(f) = 0. The theorem is a consequence of (12) and (31).
- (33) If  $I \subseteq A$  and  $f = \chi_{A,I}$ , then f is HK-integrable and HK-integral(f) = vol(I). The theorem is a consequence of (12) and (27).

Let I be a non empty, closed interval subset of  $\mathbb{R}$ . One can check that there exists a function from I into  $\mathbb{R}$  which is HK-integrable.

#### 6. The Linearity Property of the Gauge Integral

In the sequel f, g denote HK-integrable functions from I into  $\mathbb R$  and r denotes a real number.

Now we state the propositions:

- (34) Let us consider a natural number i. Suppose  $i \in \text{dom } T_1$ . Then  $(\text{tagged-volume}(r \cdot f, T_1))(i) = r \cdot f((T_1 \text{-tags})(i)) \cdot \text{vol}(\text{divset}(T_1 \text{-partition}, i))$ .
- (35) tagged-volume $(r \cdot f, T_1) = r \cdot (\text{tagged-volume}(f, T_1))$ . PROOF: For every natural number i such that  $i \in \text{dom}(\text{tagged-volume}(r \cdot f, T_1))$  holds  $(\text{tagged-volume}(r \cdot f, T_1))(i) = (r \cdot (\text{tagged-volume}(f, T_1)))(i)$ .  $\square$
- (36) Let us consider a natural number i. Suppose  $i \in \text{dom } T_1$ . Then (tagged-volume $(f+g,T_1)$ ) $(i) = f((T_1\text{-tags})(i)) \cdot \text{vol}(\text{divset}(T_1\text{-partition}, i)) + (g((T_1\text{-tags})(i)) \cdot \text{vol}(\text{divset}(T_1\text{-partition}, i)))$ . The theorem is a consequence of (23), (24), and (25).
- (37) tagged-volume $(f + g, T_1) =$  (tagged-volume $(f, T_1)$ ) + (tagged-volume $(g, T_1)$ ). PROOF: For every natural number i such that  $i \in \text{dom}(\text{tagged-volume})$

 $(f+g,T_1)$ ) holds  $(tagged-volume(f+g,T_1))(i) = ((tagged-volume(f,T_1)) + (tagged-volume(g,T_1)))(i)$ .  $\square$ 

- (38) Suppose f is HK-integrable. Then
  - (i)  $r \cdot f$  is an HK-integrable function from I into  $\mathbb{R}$ , and
  - (ii) HK-integral  $(r \cdot f) = r \cdot \text{HK-integral}(f)$ .

PROOF: Consider J being a real number such that for every real number  $\varepsilon$  such that  $\varepsilon > 0$  there exists a positive yielding function j from I into  $\mathbb{R}$  such that for every tagged partition  $T_1$  of I such that  $T_1$  is j-fine holds  $|\operatorname{tagged-sum}(f,T_1)-J| \leqslant \varepsilon$ . For every real number  $\varepsilon$  such that  $\varepsilon > 0$  there exists a positive yielding function j from I into  $\mathbb{R}$  such that for every tagged partition  $T_1$  of I such that  $T_1$  is j-fine holds  $|\operatorname{tagged-sum}(r \cdot f, T_1) - (r \cdot J)| \leqslant \varepsilon$ .  $\square$ 

- (39) (i) f + g is an HK-integrable function from I into  $\mathbb{R}$ , and
  - (ii) HK-integral(f + g) = HK-integral(f) + HK-integral(g).

PROOF: Consider  $J_1$  being a real number such that for every real number  $\varepsilon$  such that  $\varepsilon > 0$  there exists a positive yielding function j from I into  $\mathbb{R}$  such that for every tagged partition  $T_1$  of I such that  $T_1$  is j-fine holds  $|\operatorname{tagged-sum}(f,T_1)-J_1| \leqslant \varepsilon$ . Consider  $J_2$  being a real number such that for every real number  $\varepsilon$  such that  $\varepsilon > 0$  there exists a positive yielding function j from I into  $\mathbb{R}$  such that for every tagged partition  $T_1$  of I such that  $T_1$  is  $T_2$ -fine holds  $|\operatorname{tagged-sum}(g,T_1)-J_2| \leqslant \varepsilon$ . For every real number  $\varepsilon$  such that  $\varepsilon > 0$  there exists a positive yielding function j from I into  $\mathbb{R}$  such that for every tagged partition  $T_1$  of  $T_2$  such that  $T_3$  is  $T_4$ -fine holds  $|\operatorname{tagged-sum}(f_1)-f_2| = \varepsilon$ .  $|\operatorname{tagged-sum}(f_1)-f_2| = \varepsilon$ .

- (40) Let us consider a function f from I into  $\mathbb{R}$ . Suppose f is constant. Then
  - (i) f is HK-integrable, and
  - (ii) there exists a real number r such that  $f = r \cdot \chi_{I,I}$  and HK-integral $(f) = r \cdot vol(I)$ .

The theorem is a consequence of (19), (12), (33), and (38).

#### 7. RIEMANN INTEGRABILITY AND GAUGE INTEGRABILITY

Let I be a non empty, closed interval subset of  $\mathbb{R}$ . Note that there exists a function from I into  $\mathbb{R}$  which is integrable.

Let X be a non empty set. Observe that there exists a function from X into  $\mathbb R$  which is bounded.

Now we state the proposition:

(41) Let us consider a bounded function f from I into  $\mathbb{R}$ . Then  $|\sup \operatorname{rng} f - \inf \operatorname{rng} f| = 0$  if and only if f is constant. The theorem

Then  $|\sup \operatorname{rng} f - \inf \operatorname{rng} f| = 0$  if and only if f is constant. The theorem is a consequence of (11).

Let I be a non empty, closed interval subset of  $\mathbb{R}$ . Observe that there exists an integrable function from I into  $\mathbb{R}$  which is bounded.

Let us consider a partial function f from I to  $\mathbb{R}.$  Now we state the propositions:

- (42) If f is upper integrable, then there exists a real number r such that for every partition D of I,  $r < \text{upper\_sum}(f, D)$ .
- (43) If f is lower integrable, then there exists a real number r such that for every partition D of I, lower\_sum(f, D) < r.
- (44) Let us consider a function f from I into  $\mathbb{R}$ , and partitions D,  $D_1$  of I. Suppose  $D(1) = \inf I$  and  $D_1 = D_{|1}$ . Then
  - (i) upper\_sum $(f, D_1)$  = upper\_sum(f, D), and
  - (ii) lower\_sum $(f, D_1)$  = lower\_sum(f, D).

PROOF: (upper\_volume
$$(f, D)$$
)(1) = 0 by [5, (50)]. (lower\_volume $(f, D)$ )(1) = 0 by [5, (50)].  $\square$ 

In the sequel f denotes a bounded, integrable function from I into  $\mathbb{R}$ . Now we state the propositions:

- (45) Let us consider a natural number i. Suppose  $i \in \text{dom } T_1$ . Then (lower\_volume $(f, T_1\text{-partition})(i) \leq (\text{tagged-volume}(f, T_1))(i) \leq (\text{upper_volume}(f, T_1\text{-partition}))(i)$ . The theorem is a consequence of (23).
- (46)  $\sum \text{lower\_volume}(f, T_1\text{-partition}) \leq \sum (\text{tagged-volume}(f, T_1)) \leq \sum \text{upper\_volume}(f, T_1\text{-partition})$ . The theorem is a consequence of (45).
- (47) Let us consider a real number  $\varepsilon$ . Suppose I is not trivial and  $0 < \varepsilon$ . Then there exists a partition D of I such that
  - (i)  $D(1) \neq \inf I$ , and
  - (ii) upper\_sum $(f, D) < \text{integral } f + \frac{\varepsilon}{2}$ , and
  - (iii) integral  $f \frac{\varepsilon}{2} < \text{lower\_sum}(f, D)$ , and
  - (iv) upper\_sum(f, D) lower\_sum $(f, D) < \varepsilon$ .

The theorem is a consequence of (44).

From now on j denotes a positive yielding function from I into  $\mathbb{R}$ .

(48) If  $j = r \cdot \chi_{I,I}$ , then 0 < r.

In the sequel D denotes a tagged partition of I. Now we state the proposition:

(49) If  $j = r \cdot \chi_{I,I}$  and D is j-fine, then  $\delta_{D\text{-partition}} \leq r$ .

PROOF: Reconsider  $g = \chi_{I,I}$  as a function from I into  $\mathbb{R}$ . For every natural number i such that  $i \in \text{dom}(D\text{-partition})$  holds

$$(\text{upper\_volume}(g, D\text{-partition}))(i) \leqslant r. \ \delta_{D\text{-partition}} \leqslant r. \ \Box$$

From now on  $r_1$ ,  $r_2$ , s denote real numbers, D,  $D_1$  denote partitions of I, and  $f_1$  denotes a function from I into  $\mathbb{R}$ . Now we state the propositions:

- (50) There exists a natural number i such that
  - (i)  $i \in \text{dom } D$ , and
  - (ii) min rng upper\_volume $(f_1, D) = (\text{upper_volume}(f_1, D))(i)$ .
- (51) Let us consider a function f from I into  $\mathbb{R}$ , and a real number  $\varepsilon$ . Suppose  $f_1 = \chi_{I,I}$  and  $r_1 = \min \operatorname{rng} \operatorname{upper\_volume}(f_1, D_1)$  and  $r_2 = \frac{\varepsilon}{2 \cdot \operatorname{len} D_1 \cdot |\operatorname{sup} \operatorname{rng} f \inf \operatorname{rng} f|}$  and  $0 < r_1$  and  $0 < r_2$  and  $s = \frac{\min(r_1, r_2)}{2}$  and  $j = s \cdot f_1$  and  $T_1$  is j-fine. Then
  - (i)  $\delta_{T_1\text{-partition}} < \min \text{rng upper\_volume}(f_1, D_1), \text{ and}$
  - (ii)  $\delta_{T_1\text{-partition}} < \frac{\varepsilon}{2 \cdot \text{len } D_1 \cdot |\sup \text{rng } f \text{inf rng } f|}$ .

The theorem is a consequence of (49).

- (52) Let us consider a finite sequence p of elements of  $\mathbb{R}$ . Suppose for every natural number i such that  $i \in \text{dom } p$  holds  $r \leqslant p(i)$  and there exists a natural number  $i_0$  such that  $i_0 \in \text{dom } p$  and  $p(i_0) = r$ . Then  $r = \inf \text{rng } p$ .
- (53) Suppose  $f_1 = \chi_{I,I}$ . Then
  - (i)  $0 \leq \min \operatorname{rng upper\_volume}(f_1, D)$ , and
  - (ii)  $0 = \min \operatorname{rng upper\_volume}(f_1, D) \text{ iff } \operatorname{divset}(D, 1) = [D(1), D(1)].$

PROOF: Consider  $i_0$  being a natural number such that  $i_0 \in \text{dom } D$  and min rng upper\_volume $(f_1, D) = (\text{upper_volume}(f_1, D))(i_0)$ .  $0 = \min \text{ rng upper_volume}(f_1, D)$  iff divset(D, 1) = [D(1), D(1)].  $\square$ 

- (54) If divset(D, 1) = [D(1), D(1)], then  $D(1) = \inf I$ .
- (55) Let us consider a bounded, integrable function f from I into  $\mathbb{R}$ . Then
  - (i) f is HK-integrable, and
  - (ii) HK-integral f.

The theorem is a consequence of (40), (12), (17), (28), (30), (47), (53), (54), (41), (20), (46), (51), (21), (22), (7), (1), (2), and (3).

Let I be a non empty, closed interval subset of  $\mathbb{R}$ . Note that every function from I into  $\mathbb{R}$  which is bounded and integrable is also HK-integrable.
