Representation of the Fibonacci and Lucas Numbers in Terms of Floor and Ceiling

Magdalena Jastrzębska Institute of Mathematics University of Białystok Akademicka 2, 15-267 Białystok, Poland

Summary. In the paper we show how to express the Fibonacci numbers and Lucas numbers using the floor and ceiling operations.

MML identifier: FIB_NUM4, version: 7.11.05 4.134.1080

The notation and terminology used here have been introduced in the following papers: [7], [3], [8], [11], [10], [1], [4], [6], [2], [5], and [9].

1. Preliminaries

One can prove the following propositions:

- (1) For all real numbers a, b and for every natural number c holds $\left(\frac{a}{b}\right)^c = \frac{a^c}{b^c}$.
- (2) For every real number a and for all integer numbers b, c such that $a \neq 0$ holds $a^{b+c} = a^b \cdot a^c$.
- (3) For every natural number n and for every real number a such that n is even and $a \neq 0$ holds $(-a)^n = a^n$.
- (4) For every natural number n and for every real number a such that n is odd and $a \neq 0$ holds $(-a)^n = -a^n$.
- $(5) \quad |\overline{\tau}| < 1.$
- (6) For every natural number n and for every non empty real number r such that n is even holds $r^n > 0$.
- (7) For every natural number n and for every real number r such that n is odd and r < 0 holds $r^n < 0$.

- (8) For every natural number n such that $n \neq 0$ holds $\overline{\tau}^n < \frac{1}{2}$.
- (9) For all natural numbers n, m and for every real number r such that m is odd and $n \ge m$ and r < 0 and r > -1 holds $r^n \ge r^m$.
- (10) For all natural numbers n, m such that m is odd and $n \ge m$ holds $\overline{\tau}^n \ge \overline{\tau}^m$.
- (11) For all natural numbers n, m such that n is even and m is even and $n \ge m$ holds $\overline{\tau}^n \le \overline{\tau}^m$.
- (12) For all non empty natural numbers m, n such that $m \ge n$ holds $\operatorname{Luc}(m) \ge \operatorname{Luc}(n)$.
- (13) For every non empty natural number n holds $\tau^n > \overline{\tau}^n$.
- (14) For every natural number n such that n > 1 holds $-\frac{1}{2} < \overline{\tau}^n$.
- (15) For every natural number n such that n > 2 holds $\overline{\tau}^n \ge -\frac{1}{\sqrt{5}}$.
- (16) For every natural number n such that $n \ge 2$ holds $\overline{\tau}^n \le \frac{1}{\sqrt{5}}$.
- (17) For every natural number *n* holds $\frac{\overline{\tau}^n}{\sqrt{5}} + \frac{1}{2} > 0$ and $\frac{\overline{\tau}^n}{\sqrt{5}} + \frac{1}{2} < 1$.

2. Formulas for the Fibonacci Numbers

Next we state two propositions:

- (18) For every natural number *n* holds $\lfloor \frac{\tau^n}{\sqrt{5}} + \frac{1}{2} \rfloor = \operatorname{Fib}(n)$.
- (19) For every natural number n such that $n \neq 0$ holds $\lceil \frac{\tau^n}{\sqrt{5}} \frac{1}{2} \rceil = \text{Fib}(n)$. We now state a number of propositions:
- (20) For every natural number n such that $n \neq 0$ holds $\lfloor \frac{\tau^{2 \cdot n}}{\sqrt{5}} \rfloor = \text{Fib}(2 \cdot n).$
- (21) For every natural number *n* holds $\lceil \frac{\tau^{2\cdot n+1}}{\sqrt{5}} \rceil = \operatorname{Fib}(2 \cdot n+1).$
- (22) For every natural number n such that $n \ge 2$ and n is even holds $Fib(n + 1) = |\tau \cdot Fib(n) + 1|$.
- (23) For every natural number n such that $n \ge 2$ and n is odd holds $\operatorname{Fib}(n + 1) = \lceil \tau \cdot \operatorname{Fib}(n) 1 \rceil$.
- (24) For every natural number n such that $n \ge 2$ holds $\operatorname{Fib}(n+1) = \left|\frac{\operatorname{Fib}(n) + \sqrt{5} \cdot \operatorname{Fib}(n) + 1}{2}\right|$.
- (25) For every natural number n such that $n \ge 2$ holds $\operatorname{Fib}(n+1) = \left\lceil \frac{(\operatorname{Fib}(n) + \sqrt{5} \cdot \operatorname{Fib}(n)) 1}{2} \right\rceil$.
- (26) For every natural number *n* holds $\operatorname{Fib}(n+1) = \frac{\operatorname{Fib}(n) + \sqrt{5 \cdot \operatorname{Fib}(n)^2 + 4 \cdot (-1)^n}}{2}$.
- (27) For every natural number n such that $n \ge 2$ holds $\tilde{\text{Fib}}(n+1) = \lfloor \frac{\tilde{\text{Fib}}(n)+1+\sqrt{(5\cdot \tilde{\text{Fib}}(n)^2-2\cdot \tilde{\text{Fib}}(n))+1}}{2} \rfloor$.
- (28) For every natural number n such that $n \ge 2$ holds $\operatorname{Fib}(n) = \lfloor \frac{1}{\tau} \cdot (\operatorname{Fib}(n+1) + \frac{1}{2}) \rfloor$.

78

(29) For all natural numbers n, k such that $n \ge k > 1$ or k = 1 and n > k holds $|\tau^k \cdot \operatorname{Fib}(n) + \frac{1}{2}| = \operatorname{Fib}(n+k)$.

3. Formulas for the Lucas Numbers

Next we state a number of propositions:

- (30) For every natural number n such that $n \ge 2$ holds $\operatorname{Luc}(n) = |\tau^n + \frac{1}{2}|$.
- (31) For every natural number n such that $n \ge 2$ holds $\operatorname{Luc}(n) = \left[\tau^n \frac{1}{2}\right]$.
- (32) For every natural number n such that $n \ge 2$ holds $\operatorname{Luc}(2 \cdot n) = \lceil \tau^{2 \cdot n} \rceil$.
- (33) For every natural number n such that $n \ge 2$ holds $\operatorname{Luc}(2 \cdot n + 1) = |\tau^{2 \cdot n + 1}|$.
- (34) For every natural number n such that $n \ge 2$ and n is odd holds $Luc(n + 1) = |\tau \cdot Luc(n) + 1|$.
- (35) For every natural number n such that $n \ge 2$ and n is even holds $Luc(n+1) = [\tau \cdot Luc(n) 1].$
- (36) For every natural number n such that $n \neq 1$ holds $\operatorname{Luc}(n+1) = \operatorname{Luc}(n) + \sqrt{5 \cdot (\operatorname{Luc}(n)^2 4 \cdot (-1)^n)}$
- (37) For every natural number n such that $n \ge 4$ holds $\operatorname{Luc}(n+1) = \left| \frac{\operatorname{Luc}(n)+1+\sqrt{(5\cdot\operatorname{Luc}(n)^2-2\cdot\operatorname{Luc}(n))+1}}{2} \right|.$
- (38) For every natural number n such that n > 2 holds $\operatorname{Luc}(n) = \lfloor \frac{1}{\tau} \cdot (\operatorname{Luc}(n+1) + \frac{1}{2}) \rfloor$.
- (39) For all natural numbers n, k such that $n \ge 4$ and $k \ge 1$ and n > k and n is odd holds $\operatorname{Luc}(n+k) = |\tau^k \cdot \operatorname{Luc}(n) + 1|$.
