Summary. In this article we define the notion of abstract simplicial complexes and operations on them. We introduce the following basic notions: simplex, face, vertex, degree, skeleton, subdivision and substructure, and prove some of their properties.

MML identifier: SIMPLEX0, version: 7.11.05 4.134.1080

The articles [2], [5], [6], [10], [8], [14], [1], [7], [3], [4], [11], [13], [16], [12], [15], and [9] provide the notation and terminology for this paper.

1. Preliminaries

For simplicity, we adopt the following convention: \(x, y, X, Y, Z\) are sets, \(D\) is a non empty set, \(n, k\) are natural numbers, and \(i, i_1, i_2\) are integers.

Let us consider \(X\). We introduce \(X\) has empty element as an antonym of \(X\) has non empty elements.

Note that there exists a set which is empty and finite-membered and every set which is empty is also finite-membered. Let \(X\) be a finite set. Note that \(\{X\}\) is finite-membered and \(2^X\) is finite-membered. Let \(Y\) be a finite set. Observe that \(\{X,Y\}\) is finite-membered.

Let \(X\) be a finite-membered set. Observe that every subset of \(X\) is finite-membered. Let \(Y\) be a finite-membered set. One can check that \(X \cup Y\) is finite-membered.

Let \(X\) be a finite finite-membered set. Note that \(\bigcup X\) is finite.

One can verify the following observations:

* every set which is empty is also subset-closed,
* every set which has empty element is also non empty,
* every set which is non empty and subset-closed has also empty element, and
* there exists a set which has empty element.

Let us consider $X$. Observe that $\text{SubFin}(X)$ is finite-membered and there exists a family of subsets of $X$ which is subset-closed, finite, and finite-membered.

Let $X$ be a subset-closed set. One can check that $\text{SubFin}(X)$ is subset-closed.

Next we state the proposition

(1) $Y$ is subset-closed iff for every $X$ such that $X \in Y$ holds $2^X \subseteq Y$.

Let $A, B$ be subset-closed sets. Note that $A \cup B$ is subset-closed and $A \cap B$ is subset-closed.

Let us consider $X$. The subset-closure of $X$ yields a subset-closed set and is defined by the conditions (Def. 1).

(Def. 1)(i) $X \subseteq \text{the subset-closure of } X$, and

(ii) for every $Y$ such that $X \subseteq Y$ and $Y$ is subset-closed holds the subset-closure of $X \subseteq Y$.

The following proposition is true

(2) $x \in \text{the subset-closure of } X$ iff there exists $y$ such that $x \subseteq y$ and $y \in X$.

Let us consider $X$ and let $F$ be a family of subsets of $X$. Then the subset-closure of $F$ is a subset-closed family of subsets of $X$.

Observe that the subset-closure of $\emptyset$ is empty. Let $X$ be a non empty set. Note that the subset-closure of $X$ is non empty.

Let $X$ be a set with a non-empty element. One can check that the subset-closure of $X$ has a non-empty element.

Let $X$ be a finite-membered set. Note that the subset-closure of $X$ is finite-membered.

The following propositions are true:

(3) If $X \subseteq Y$ and $Y$ is subset-closed, then the subset-closure of $X \subseteq Y$.

(4) The subset-closure of $\{X\} = 2^X$.

(5) The subset-closure of $X \cup Y = (\text{the subset-closure of } X) \cup (\text{the subset-closure of } Y)$.

(6) $X$ is finer than $Y$ iff the subset-closure of $X \subseteq Y$.

(7) If $X$ is subset-closed, then the subset-closure of $X = X$.

(8) If the subset-closure of $X \subseteq X$, then $X$ is subset-closed.

Let us consider $Y$, $X$ and let $n$ be a set. The subsets of $X$ and $Y$ with cardinality limited by $n$ yields a family of subsets of $Y$ and is defined by the condition (Def. 2).

(Def. 2) Let $A$ be a subset of $Y$. Then $A \in \text{the subsets of } X$ and $Y$ with cardinality limited by $n$ if and only if $A \in X$ and $\text{Card } A \subseteq \text{Card } n$. 
Let us consider $D$. One can verify that there exists a family of subsets of $D$ which is finite, subset-closed, and finite-membered and has a non-empty element.

Let us consider $Y$, $X$ and let $n$ be a finite set. One can check that the subsets of $X$ and $Y$ with cardinality limited by $n$ is subset-closed.

Let us consider $Y$, let $X$ be a subset-closed set, and let $n$ be a set. Note that the subsets of $X$ and $Y$ with cardinality limited by $n$ is subset-closed.

Let us consider $Y$, let $X$ be a set with empty element, and let $n$ be a set. One can check that the subsets of $X$ and $Y$ with cardinality limited by $n$ has empty element.

Let us consider $D$, let $X$ be a subset-closed family of subsets of $D$ with a non-empty element, and let $n$ be a non empty set. Note that the subsets of $X$ and $D$ with cardinality limited by $n$ has a non-empty element.

Let us consider $X$, let $Y$ be a family of subsets of $X$, and let $n$ be a set. We introduce the subsets of $Y$ with cardinality limited by $n$ as a synonym of the subsets of $Y$ and $X$ with cardinality limited by $n$.

Let us observe that every set which is empty is also $\subseteq$-linear and there exists a set which is empty and $\subseteq$-linear.

Let $X$ be a $\subseteq$-linear set. Note that every subset of $X$ is $\subseteq$-linear.

The following propositions are true:

(9) If $X$ is non empty, finite, and $\subseteq$-linear, then $\bigcup X \in X$.

(10) For every finite $\subseteq$-linear set $X$ such that $X$ has non empty elements holds $\text{Card } X \subseteq \text{Card } \bigcup X$.

(11) If $X$ is $\subseteq$-linear and $\bigcup X$ misses $x$, then $X \cup \{\bigcup X \cup x\}$ is $\subseteq$-linear.

(12) Let $X$ be a non empty set. Then there exists a family $Y$ of subsets of $X$ such that

(i) $Y$ is $\subseteq$-linear and has non empty elements,
(ii) $X \in Y$,
(iii) $\text{Card } X = \text{Card } Y$, and
(iv) for every $Z$ such that $Z \in Y$ and $\text{Card } Z \neq 1$ there exists $x$ such that $x \in Z$ and $Z \setminus \{x\} \in Y$.

(13) Let $Y$ be a family of subsets of $X$. Suppose $Y$ is finite and $\subseteq$-linear and has non empty elements and $X \in Y$. Then there exists a family $Y'$ of subsets of $X$ such that

(i) $Y \subseteq Y'$,
(ii) $Y'$ is $\subseteq$-linear and has non empty elements,
(iii) $\text{Card } X = \text{Card } Y'$, and
(iv) for every $Z$ such that $Z \in Y'$ and $\text{Card } Z \neq 1$ there exists $x$ such that $x \in Z$ and $Z \setminus \{x\} \in Y'$. 

2. SIMPLICIAL COMPLEXES

A simplicial complex structure is a topological structure.
In the sequel $K$ denotes a simplicial complex structure.
Let us consider $K$ and let $A$ be a subset of $K$. We introduce $A$ is simplex-like as a synonym of $A$ is open.
Let us consider $K$ and let $S$ be a family of subsets of $K$. We introduce $S$ is simplex-like as a synonym of $S$ is open.
Let us consider $K$. One can check that there exists a family of subsets of $K$ which is empty and simplex-like.
The following proposition is true
(14) For every family $S$ of subsets of $K$ holds $S$ is simplex-like iff $S \subseteq$ the topology of $K$.
Let us consider $K$ and let $v$ be an element of $K$. We say that $v$ is vertex-like if and only if:
(Def. 3) There exists a subset $S$ of $K$ such that $S$ is simplex-like and $v \in S$.
Let us consider $K$. The functor Vertices $K$ yielding a subset of $K$ is defined by:
(Def. 4) For every element $v$ of $K$ holds $v \in$ Vertices $K$ iff $v$ is vertex-like.
Let $K$ be a simplicial complex structure. A vertex of $K$ is an element of Vertices $K$.
Let $K$ be a simplicial complex structure. We say that $K$ is finite-vertices if and only if:
(Def. 5) Vertices $K$ is finite.
Let us consider $K$. We say that $K$ is locally-finite if and only if:
(Def. 6) For every vertex $v$ of $K$ holds $\{S \subseteq K: S$ is simplex-like $\land v \in S\}$ is finite.
Let us consider $K$. We say that $K$ is empty-membered if and only if:
(Def. 7) The topology of $K$ is empty-membered.
We say that $K$ has non empty elements if and only if:
(Def. 8) The topology of $K$ has non empty elements.
Let us consider $K$. We introduce $K$ has a non-empty element as an antonym of $K$ is empty-membered. We introduce $K$ has empty element as an antonym of $K$ has non empty elements.
Let us consider $X$. A simplicial complex structure is said to be a simplicial complex structure of $X$ if:
(Def. 9) $\Omega_{\text{it}} \subseteq X$.
Let us consider $X$ and let $K_1$ be a simplicial complex structure of $X$. We say that $K_1$ is total if and only if:
(Def. 10) \( \Omega_{(K_1)} = X \).

One can check the following observations:

* every simplicial complex structure which has empty element is also non void,
* every simplicial complex structure which has a non-empty element is also non void,
* every simplicial complex structure which is non void and empty-membered has also empty element,
* every simplicial complex structure which is non void and subset-closed has also empty element,
* every simplicial complex structure which is empty-membered is also subset-closed and finite-vertices,
* every simplicial complex structure which is finite-vertices is also locally-finite and finite-degree, and
* every simplicial complex structure which is locally-finite and subset-closed is also finite-membered.

Let us consider \( X \). Observe that there exists a simplicial complex structure of \( X \) which is empty, void, empty-membered, and strict.

Let us consider \( D \). Note that there exists a simplicial complex structure of \( D \) which is non empty, non void, total, empty-membered, and strict and there exists a simplicial complex structure of \( D \) which is non empty, total, finite-vertices, subset-closed, and strict and has empty element and a non-empty element.

Let us observe that there exists a simplicial complex structure which is non empty, finite-vertices, subset-closed, and strict and has empty element and a non-empty element.

Let \( K \) be a simplicial complex structure with a non-empty element. Observe that Vertices \( K \) is non empty.

Let \( K \) be a finite-vertices simplicial complex structure. Note that every family of subsets of \( K \) which is simplex-like is also finite.

Let \( K \) be a finite-membered simplicial complex structure. Note that every family of subsets of \( K \) which is simplex-like is also finite-membered.

Next we state several propositions:

(15) Vertices \( K \) is empty iff \( K \) is empty-membered.

(16) Vertices \( K = \bigcup \text{(the topology of } K) \).

(17) For every subset \( S \) of \( K \) such that \( S \) is simplex-like holds \( S \subseteq \text{Vertices } K \).

(18) If \( K \) is finite-vertices, then the topology of \( K \) is finite.

(19) If the topology of \( K \) is finite and \( K \) is non finite-vertices, then \( K \) is non finite-membered.

(20) If \( K \) is subset-closed and the topology of \( K \) is finite, then \( K \) is finite-vertices.
3. The Simplicial Complex Generated on the Set

Let us consider $X$ and let $Y$ be a family of subsets of $X$. The complex of $Y$ yielding a strict simplicial complex structure of $X$ is defined as follows:

(Def. 11) The complex of $Y = \langle X, \text{the subset-closure of } Y \rangle$.

Let us consider $X$ and let $Y$ be a family of subsets of $X$. One can verify that the complex of $Y$ is total and subset-closed.

Let us consider $X$ and let $Y$ be a non empty family of subsets of $X$. Note that the complex of $Y$ has empty element.

Let us consider $X$ and let $Y$ be a finite-membered family of subsets of $X$. Note that the complex of $Y$ is finite-membered.

Let us consider $X$ and let $Y$ be a finite finite-membered family of subsets of $X$. Observe that the complex of $Y$ is finite-vertices.

One can prove the following proposition

(21) If $K$ is subset-closed, then the topological structure of $K = \text{the complex of the topology of } K$.

Let us consider $X$. A simplicial complex of $X$ is a finite-membered subset-closed simplicial complex structure of $X$.

Let $K$ be a non void simplicial complex structure. A simplex of $K$ is a simplex-like subset of $K$.

Let $K$ be a simplicial complex structure with empty element. One can check that every subset of $K$ which is empty is also simplex-like and there exists a simplex of $K$ which is empty.

Let $K$ be a non void finite-membered simplicial complex structure. Note that there exists a simplex of $K$ which is finite.

4. The Degree of Simplicial Complexes

Let us consider $K$. The functor $\text{degree}(K)$ yields an extended real number and is defined as follows:

(Def. 12)(i) For every finite subset $S$ of $K$ such that $S$ is simplex-like holds $\overline{S} \leq \text{degree}(K) + 1$ and there exists a subset $S$ of $K$ such that $S$ is simplex-like and Card$S = \text{degree}(K) + 1$ if $K$ is non void and finite-degree,

(ii) $\text{degree}(K) = -1$ if $K$ is void,

(iii) $\text{degree}(K) = +\infty$, otherwise.

Let $K$ be a finite-degree simplicial complex structure. Note that $\text{degree}(K) + 1$ is natural and $\text{degree}(K)$ is integer.

The following propositions are true:

(22) $\text{degree}(K) = -1$ iff $K$ is empty-membered.

(23) $-1 \leq \text{degree}(K)$. 

(24) For every finite subset $S$ of $K$ such that $S$ is simplex-like holds $\overline{S} \leq \text{degree}(K) + 1$.

(25) Suppose $K$ is non void or $i \geq -1$. Then $\text{degree}(K) \leq i$ if and only if the following conditions are satisfied:
   (i) $K$ is finite-membered, and
   (ii) for every finite subset $S$ of $K$ such that $S$ is simplex-like holds $\overline{S} \leq i+1$.

(26) For every finite subset $A$ of $X$ holds $\text{degree}(\text{the complex of } \{A\}) = A - 1$.

5. Subcomplexes

Let us consider $X$ and let $K_1$ be a simplicial complex structure of $X$. A simplicial complex of $X$ is said to be a subsimplicial complex of $K_1$ if:

(Def. 13) $\Omega_{\text{it}} \subseteq \Omega(K_1)$ and the topology of it $\subseteq$ the topology of $K_1$.

In the sequel $K_1$ denotes a simplicial complex structure of $X$ and $S_1$ denotes a subsimplicial complex of $K_1$.

Let us consider $X$, $K_1$. One can check that there exists a subsimplicial complex of $K_1$ which is empty, void, and strict.

Let us consider $X$ and let $K_1$ be a void simplicial complex structure of $X$. Observe that every subsimplicial complex of $K_1$ is void.

Let us consider $D$ and let $K_2$ be a non void subset-closed simplicial complex structure of $D$. Note that there exists a subsimplicial complex of $K_2$ which is non void.

Let us consider $X$ and let $K_1$ be a finite-vertices simplicial complex structure of $X$. One can check that every subsimplicial complex of $K_1$ is finite-vertices.

Let us consider $X$ and let $K_1$ be a finite-degree simplicial complex structure of $X$. Note that every subsimplicial complex of $K_1$ is finite-degree.

Next we state several propositions:

(27) Every subsimplicial complex of $S_1$ is a subsimplicial complex of $K_1$.

(28) Let $A$ be a subset of $K_1$ and $S$ be a finite-membered family of subsets of $A$. Suppose the subset-closure of $S \subseteq$ the topology of $K_1$. Then the complex of $S$ is a strict subsimplicial complex of $K_1$.

(29) Let $K_1$ be a subset-closed simplicial complex structure of $X$, $A$ be a subset of $K_1$, and $S$ be a finite-membered family of subsets of $A$. Suppose $S \subseteq$ the topology of $K_1$. Then the complex of $S$ is a strict subsimplicial complex of $K_1$.

(30) Let $Y_1$, $Y_2$ be families of subsets of $X$. Suppose $Y_1$ is finite-membered and finer than $Y_2$. Then the complex of $Y_1$ is a subsimplicial complex of the complex of $Y_2$.

(31) Vertices $S_1 \subseteq$ Vertices $K_1$.

(32) $\text{degree}(S_1) \leq \text{degree}(K_1)$. 
Let us consider $X, K_1, S_1$. We say that $S_1$ is maximal if and only if:

(Def. 14) For every subset $A$ of $S_1$ such that $A \in$ the topology of $K_1$ holds $A$ is simplex-like.

We now state the proposition

(33) $S_1$ is maximal iff $2^{\Omega(S_1)} \cap$ the topology of $K_1 \subseteq$ the topology of $S_1$.

Let us consider $X, K_1$. Note that there exists a subsimplicial complex of $K_1$ which is maximal and strict.

We now state three propositions:

(34) Let $S_2$ be a subsimplicial complex of $S_1$. Suppose $S_1$ is maximal and $S_2$ is maximal. Then $S_2$ is a maximal subsimplicial complex of $K_1$.

(35) Let $S_2$ be a subsimplicial complex of $S_1$. If $S_2$ is a maximal subsimplicial complex of $K_1$, then $S_2$ is maximal.

(36) Let $K_3, K_4$ be maximal subsimplicial complexes of $K_1$. Suppose $\Omega(K_3) = \Omega(K_4)$. Then the topological structure of $K_3 = \text{the topological structure of } K_4$.

Let us consider $X$, let $K_1$ be a subset-closed simplicial complex structure of $X$, and let $A$ be a subset of $K_1$. Let us assume that $2^A \cap$ the topology of $K_1$ is finite-membered. The functor $K_1|A$ yields a maximal strict subsimplicial complex of $K_1$ and is defined as follows:

(Def. 15) $\Omega_{K_1|A} = A$.

In the sequel $S_3$ denotes a simplicial complex of $X$.

Let us consider $X, S_3$ and let $A$ be a subset of $S_3$. Then $S_3|A$ is a maximal strict subsimplicial complex of $S_3$ and it can be characterized by the condition:

(Def. 16) $\Omega_{S_3|A} = A$.

The following four propositions are true:

(37) For every subset $A$ of $S_3$ holds the topology of $S_3|A = 2^A \cap$ the topology of $S_3$.

(38) For all subsets $A, B$ of $S_3$ and for every subset $B'$ of $S_3|A$ such that $B' = B$ holds $S_3|A|B' = S_3|B$.

(39) $S_3|\Omega(S_3) = \text{the topological structure of } S_3$.

(40) For all subsets $A, B$ of $S_3$ such that $A \subseteq B$ holds $S_3|A$ is a subsimplicial complex of $S_3|B$.

Let us observe that every integer is finite.

6. The Skeleton of a Simplicial Complex

Let us consider $X, K_1$ and let $i$ be a real number. The skeleton of $K_1$ and $i$ yielding a simplicial complex structure of $X$ is defined by the condition (Def. 17).
(Def. 17) The skeleton of $K_1$ and $i = \text{the complex of the subsets of the topology of } K_1 \text{ with cardinality limited by } i + 1$.

Let us consider $X$, $K_1$. Observe that the skeleton of $K_1$ and $-1$ is empty-membered. Let us consider $i$. Note that the skeleton of $K_1$ and $i$ is finite-degree.

Let us consider $X$, let $K_1$ be an empty-membered simplicial complex structure of $X$, and let us consider $i$. One can check that the skeleton of $K_1$ and $i$ is empty-membered.

Let us consider $D$, let $K_2$ be a non void subset-closed simplicial complex structure of $D$, and let us consider $i$. One can check that the skeleton of $K_2$ and $i$ is non void.

One can prove the following proposition

(41) If $-1 \leq i_1 \leq i_2$, then the skeleton of $K_1$ and $i_1$ is a subsimplicial complex of the skeleton of $K_1$ and $i_2$.

Let us consider $X$, let $K_1$ be a subset-closed simplicial complex structure of $X$, and let us consider $i$. Then the skeleton of $K_1$ and $i$ is a subsimplicial complex of $K_1$.

We now state several propositions:

(42) If $K_1$ is subset-closed and the skeleton of $K_1$ and $i$ is empty-membered, then $K_1$ is empty-membered or $i = -1$.

(43) $\text{degree}(\text{the skeleton of } K_1 \text{ and } i) \leq \text{degree}(K_1)$.

(44) If $-1 \leq i$, then $\text{degree}(\text{the skeleton of } K_1 \text{ and } i) \leq i$.

(45) If $-1 \leq i$ and the skeleton of $K_1$ and $i$ is the topological structure of $K_1$, then $\text{degree}(K_1) \leq i$.

(46) If $K_1$ is subset-closed and $\text{degree}(K_1) \leq i$, then the skeleton of $K_1$ and $i$ is the topological structure of $K_1$.

In the sequel $K$ is a non void subset-closed simplicial complex structure.

Let us consider $K$ and let $i$ be a real number. Let us assume that $i$ is integer.

A finite simplex of $K$ is said to be a simplex of $i$ and $K$ if:

(Def. 18)(i) $\bar{i} = i + 1$ if $-1 \leq i \leq \text{degree}(K)$,

(ii) it is empty, otherwise.

Let us consider $K$. Note that every simplex of $-1$ and $K$ is empty.

The following three propositions are true:

(47) For every simplex $S$ of $i$ and $K$ such that $S$ is non empty holds $i$ is natural.

(48) Every finite simplex $S$ of $K$ is a simplex of $\bar{S} - 1$ and $K$.

(49) Let $K$ be a non void subset-closed simplicial complex structure of $D$, $S$ be a non void subsimplicial complex of $K$, $i$ be an integer, and $A$ be a simplex of $i$ and $S$. If $A$ is non empty or $i \leq \text{degree}(S)$ or $\text{degree}(S) = \text{degree}(K)$, then $A$ is a simplex of $i$ and $K$. 

Let us consider $K$ and let $i$ be a real number. Let us assume that $i$ is integer and $i \leq \text{degree}(K)$. Let $S$ be a simplex of $i$ and $K$. A simplex of $\max(i - 1, -1)$ and $K$ is said to be a face of $S$ if:

(Def. 19) It $\subseteq S$.

One can prove the following proposition

(50) Let $S$ be a simplex of $n$ and $K$. Suppose $n \leq \text{degree}(K)$. Then $X$ is a face of $S$ if and only if there exists $x$ such that $x \in S$ and $S \setminus \{x\} = X$.

7. The Subdivision of a Simplicial Complex

In the sequel $P$ is a function. Let us consider $X, K_1, P$. The functor subdivision($P, K_1$) yields a strict simplicial complex structure of $X$ and is defined by the conditions (Def. 20).

(Def. 20) (i) $\Omega_{\text{subdivision}}(P, K_1) = \Omega_{\Omega(K_1)}$, and
(ii) for every subset $A$ of subdivision($P, K_1$) holds $A$ is simplex-like iff there exists a $\subseteq$-linear finite simplex-like family $S$ of subsets of $K_1$ such that $A = P^oS$.

Let us consider $X, K_1, P$. One can verify that subdivision($P, K_1$) is subset-closed and finite-membered and has empty element.

Let us consider $X$, let $K_1$ be a void simplicial complex structure of $X$, and let us consider $P$. Observe that subdivision($P, K_1$) is empty-membered.

The following propositions are true:

(51) $\text{degree}(\text{subdivision}(P, K_1)) \leq \text{degree}(K_1) + 1$.

(52) If $\text{dom} P$ has non empty elements, then $\text{degree}(\text{subdivision}(P, K_1)) \leq \text{degree}(K_1)$.

Let us consider $X$, let $K_1$ be a finite-degree simplicial complex structure of $X$, and let us consider $P$. Note that subdivision($P, K_1$) is finite-degree.

Let us consider $X$, let $K_1$ be a finite-vertices simplicial complex structure of $X$, and let us consider $P$. One can check that subdivision($P, K_1$) is finite-vertices.

One can prove the following propositions:

(53) Let $K_1$ be a subset-closed simplicial complex structure of $X$ and given $P$. Suppose that
(i) $\text{dom} P$ has non empty elements, and
(ii) for every $n$ such that $n \leq \text{degree}(K_1)$ there exists a subset $S$ of $K_1$ such that $S$ is simplex-like and $\text{Card } S = n + 1$ and $2^S_+ \subseteq \text{dom } P$ and $P^o2^S_+$ is a subset of $K_1$ and $P|^{2^S_+}$ is one-to-one.
Then $\text{degree}(\text{subdivision}(P, K_1)) = \text{degree}(K_1)$.

(54) If $Y \subseteq Z$, then subdivision($P|Y, K_1$) is a subsimplicial complex of subdivision($P|Z, K_1$).
(55) If \( \text{dom } P \cap \text{ the topology of } K_1 \subseteq Y \), then \( \text{subdivision}(P|Y, K_1) = \text{subdivision}(P, K_1) \).

(56) If \( Y \subseteq Z \), then \( \text{subdivision}(Y|P, K_1) \) is a subsimplicial complex of \( \text{subdivision}(Z|P, K_1) \).

(57) If \( P^o (\text{the topology of } K_1) \subseteq Y \), then \( \text{subdivision}(Y|P, K_1) = \text{subdivision}(P, K_1) \).

(58) \( \text{subdivision}(P, S_1) \) is a subsimplicial complex of \( \text{subdivision}(P, K_1) \).

(59) For every subset \( A \) of \( \text{subdivision}(P, K_1) \) such that \( \text{dom } P \subseteq \text{the topology of } S_1 \) and \( A = \Omega_{(S_1)} \) holds \( \text{subdivision}(P|S_1) = \text{subdivision}(P, K_1)|A \).

(60) Let \( K_3, K_4 \) be simplicial complex structures of \( X \). Suppose the topological structure of \( K_3 = \text{the topological structure of } K_4 \). Then \( \text{subdivision}(P, K_3) = \text{subdivision}(P, K_4) \).

Let us consider \( X, K_1, P, n \). The functor \( \text{subdivision}(n, P, K_1) \) yielding a simplicial complex structure of \( X \) is defined by the condition (Def. 21).

(Def. 21) There exists a function \( F \) such that

(i) \( F(0) = K_1 \),

(ii) \( F(n) = \text{subdivision}(n, P, K_1) \),

(iii) \( \text{dom } F = \mathbb{N} \), and

(iv) for every \( k \) and for every simplicial complex structure \( K'_1 \) of \( X \) such that \( K'_1 = F(k) \) holds \( F(k + 1) = \text{subdivision}(P, K'_1) \).

Next we state several propositions:

(61) \( \text{subdivision}(0, P, K_1) = K_1 \).

(62) \( \text{subdivision}(1, P, K_1) = \text{subdivision}(P, K_1) \).

(63) For every natural number \( n \) such that \( n = n + k \) holds \( \text{subdivision}(n, P, K_1) = \text{subdivision}(n, P, \text{subdivision}(k, P, K_1)) \).

(64) \( \Omega_{\text{subdivision}(n, P, K_1)} = \Omega_{(K_1)} \).

(65) \( \text{subdivision}(n, P, S_1) \) is a subsimplicial complex of \( \text{subdivision}(n, P, K_1) \).
